Parkview Hospital to Implement ChartAccess EMR from Prognosis Health Information Systems

(March 4, 2009 -- Houston) -- Parkview Hospital, a 16-bed critical access facility in Wheeler, Texas, has entered into an agreement to implement an electronic medical records (EMR) system from Prognosis Health Information Systems.

“All hospitals eventually need to implement electronic medical records. Just because we are a small rural hospital, though, doesn’t mean we have to sit on the sidelines and wait. We want to be ahead of the curve because we know that is what’s good for our hospital — and, more importantly, good for our patients,” said Ann Fagan Cook, CEO at Parkview.

Parkview chose to implement ChartAccess EMR because the system is specifically designed to overcome many of the frequently cited obstacles to EMR success. Most importantly, the system is customized to support existing workflow and processes, making it possible for Parkview to implement the technology without having to reinvent clinicians’ and other staff members’ preferred practices. In addition, ChartAccess is user-friendly, with screens that look similar to e-mail interfaces, making it easy for doctors, even those who are technology resistant, to utilize the system right out of the box.

The system’s competitive pricing makes it easy for health organizations — even small hospitals such as Parkview — to make the initial investment in an EMR. A unique phased implementation that ties

payments to achievable milestones also helps reduce the financial risk sometimes associated with EMR implementations.

Because the system is built on 21st century technology and offered via an application service provider (ASP) model, Parkview can quickly adapt it to meet its unique needs. In addition, because the system is remotely hosted and accessed via any computer with a web browser, Parkview is planning on a quick installation — and minimal ongoing maintenance. ChartAccess has earned certified status from the Certified Commission for Healthcare Information Technology, which ensures that the system meets a rigorous set of basic functionality requirements, thereby reducing the risk associated with implementing EMRs.

“Electronic medical records are no longer a luxury for health organizations. As part of the economic stimulus program, President Obama is demanding and providing funding for the adoption of such technology. What we are doing at Prognosis, though, is providing the technology and the support that will turn this vision into reality. We are making it possible for all health organizations to move forward and experience the clinical and financial benefits that have been associated with EMRs for so many years,” says Dr. John C. Joe, Chief Medical Officer and CEO at Prognosis.

About Prognosis Health Information Systems

Prognosis Health Information Systems, Inc., aims to improve the quality and safety of patient care in America by providing highly affordable, functional and usable information systems for hospitals. The Houston-based company, which was built by leveraging the healthcare industry experiences of a business software vendor and a medical records service and software provider, offers the information technology, service and support that makes EMR success a realistic goal for all healthcare organizations. Prognosis offers ChartAccess, an EMR developed by doctors that makes it easy to afford, use, implement and maintain an electronic medical records system.
